

Admin Dashboard — Retention (lean spec)

Season 1 · 5 blocks · figures the founder needs to read retention

KEEP IT SIMPLE · ~3 DEV-DAYS · NUMBERS OVER CHARTS

What I actually want: the numbers — not fancy charts

The goal is the **figures themselves**, shown simply: a number on screen, or a plain HTML table. No animated dashboards, no polished dataviz, no chart libraries needed. The mini-previews in this doc only show **intent** — a raw number or a basic table is perfectly fine, and preferred if it ships faster. Please don't over-engineer the visuals; correct figures, fast, is the whole point.

00 The one rule everything is counted from

Every metric counts a **validated lineup ("compo")** — never "app opened", never "is a member". A user who opens the app but does not submit a 5-player lineup did not play, and must not be counted as active/retained anywhere.

"Night" = NBA match night (US/EST via the Goalserve date field), not the calendar day. "Per night" metrics run on match-nights only.

ASSUMED TABLES — CONFIRM / ADJUST NAMES:

```
lineups(id, user_id, league_id, night_date, validated_at) # one row per validated lineup
users(id, created_at)
leagues(id, type ['global'|'public'|'private'], created_by)
match_nights(night_date) # nights with NBA games, from Goalserve
```

01 The 5 blocks

In priority order. Block 1 = the quick top-bar counters.

1 · Top-bar counters

WHAT Five quick numbers, plainly displayed at the top.

Downloads — total users (+ today's signups). · **DAU** — distinct users who validated a lineup tonight. · **DAU · 7-day rolling avg** — average nightly DAU over the last 7 match-nights (**used for sponsor billing**). · **Lineups tonight** — count of validated lineups for tonight. · **Account deletions** — fulfilled GDPR erasure requests (mandatory + churn signal).

APERÇU — ILLUSTRATIF. UN SIMPLE NOMBRE / TABLEAU SUFFIT.

2 · Cohort retention grid — THE CORE

WHAT Rows = signup week, columns = J1 / J3 / J7 / J14 / J30 / J60 / J90. Each cell = % of the cohort that validated a lineup at that offset. A plain colored table is enough — this IS just numbers in a grid.

RULE Retained at day **n** = the user validated ≥ 1 lineup on calendar day (`signup_date + n`). The empty "triangle" for young cohorts is expected.

```
WITH cohort AS (  
  SELECT id AS user_id,  
         date_trunc('week', created_at)::date AS cohort_week,  
         created_at::date AS signup_date  
  FROM users )  
SELECT c.cohort_week,  
       count(DISTINCT c.user_id) AS cohort_size,  
       count(DISTINCT l.user_id) FILTER (  
         WHERE l.night_date = c.signup_date + INTERVAL '30 days'  
       ) AS retained_d30      -- repeat for n = 1,3,7,14,30,60,90  
FROM cohort c  
LEFT JOIN lineups l ON l.user_id = c.user_id  
GROUP BY c.cohort_week;  -- rate = retained_dN / cohort_size
```

APERÇU — UN TABLEAU COLORÉ SUFFIT. C'EST JUSTE DES NOMBRES.

	J1	J7	J14	J30	J60	J90
S1	42%	22%	14%	9%	7%	6%
S2	38%	19%	12%	8%	6%	—
S3	45%	25%	17%	11%	—	—
S4	40%	20%	13%	—	—	—
S5	43%	23%	—	—	—	—

Gives → **D1 / D7 / D30**, the December decision figures.

3 · Activation (first lineup)

WHAT Share of new signups who have **ever** validated a first lineup — a lifetime OFF → ON flag. One number.

```
SELECT count(DISTINCT l.user_id)::float  
       / count(DISTINCT u.id) AS activation_rate  
FROM users u  
LEFT JOIN lineups l ON l.user_id = u.id;
```

APERÇU — ILLUSTRATIF. UN SIMPLE NOMBRE / TABLEAU SUFFIT.

52%

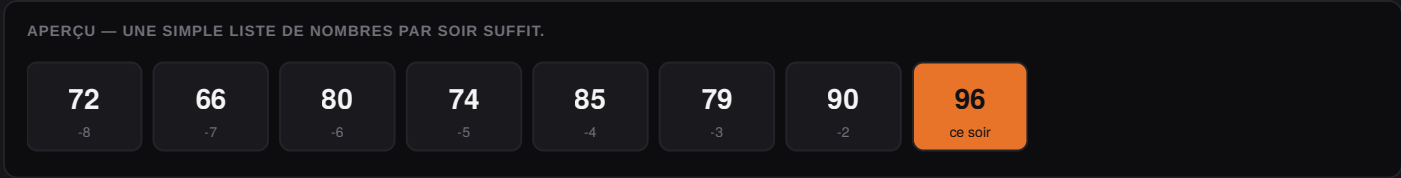

of new signups have played a first lineup

Gives → the **Activation** figure.

4 · Lineup volume per night (last 30)

WHAT Simple count of validated lineups each night, over the last 30 match-nights. No ratio. A number per night (a list is fine); a basic line is optional. Purpose: spot a sudden drop (bug, post-launch decay).

```
SELECT l.night_date, count(*) AS lineups_count
FROM lineups l
WHERE l.night_date IN (
  SELECT night_date FROM match_nights
  ORDER BY night_date DESC LIMIT 30 )
GROUP BY l.night_date
ORDER BY l.night_date;
```

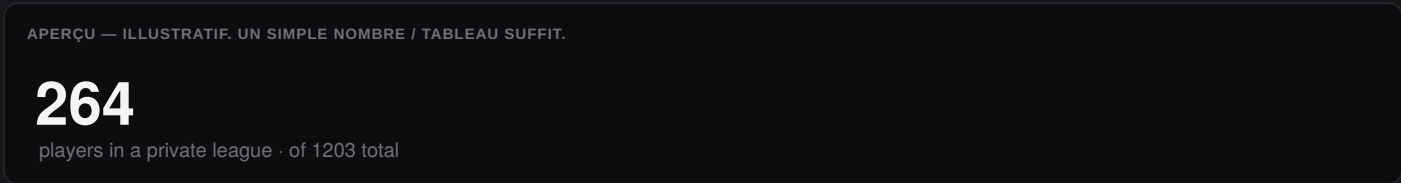

Gives → engagement trend (early warning).

5 · Players in a private league (count)

WHAT The **number** of players who play in ≥ 1 private league (last 30 match-nights). Not a percentage. Show the total next to it for context if easy. Solo and private are not exclusive — a player can be both.

```
SELECT count(DISTINCT l.user_id) AS players_in_private
FROM lineups l
JOIN leagues lg ON lg.id = l.league_id
WHERE lg.type='private'
AND l.night_date IN last_30_match_nights;
```

Gives → social-adoption figure.
